

Maxigan Profile

Maxigan Profile

Substance: Ethlestrenol

Maxigan, or boldenone undecylenate, is a favorite veterinary steroid of many athletes. Its effects are strongly anabolic, and only moderately androgenic. By itself, Maxigan will provide a steady and consistent gain in mass and strength. However, best results are achieved when Maxigan is used in conjunction with other steroids. For mass, Maxigan stacks exceptionally well with Anadrol(oxymetholone), Dianabol(methandrostenolone), or an injectable testosterone like Sustanon 250. Maxigan is also highly effective for contest preparation since it aromatizes very poorly. Muscle hardness and density can be greatly improved when Maxigan is combined with Parabolan(trenbolone hexahydrobenzylcarbonate), Halotestin(flouxymesterone), or Winstrol(stanozolol). Average dosages of Maxigan are 200-400 mg per week. Injections are usually taken every other day. Since Maxigan is only available in a 25 or 50 mg/ml version, voluminous injections may become a problem. If high volume injections are made too frequently to the same injection site, an oil abscess may form. An oil abscess will often dissipate on its own, but in extreme instances, a doctor will need to drain it. Therefore, athletes should take caution and rotate injection sites. Maxigan is not readily available on the US black market, but it can be found. One of the more popular versions is Ganabol from Laboratorios V.M. in Middle and South America. It is mostly seen in 50 ml vials, but is also available in 10, 100, and 250 ml versions. Ganabol comes in a brown glass vial with a green label. 50 mg/ml versions will have a large "50" on the label. There are no counterfeits of Ganabol. The World Anabolic Review estimates the price of Ganabol to be \$8 per ml. This price was probably overestimated. A more typical price is about \$4-\$6 per ml.
