

Proviron Profile

Proviron Profile

Substance: Mesterolone

Proviron is a synthetic androgenic steroid and oral antiestrogen used by bodybuilders. A lot of bodybuilders take Proviron for two main reasons. They use it to restore sexual disfunctions caused by steroid cycling. Proviron will help get rid of the lack of sexual desire that most bodybuilders experience during a long steroid cycle. Proviron also will help with the decreased sperm count and quality that steroids exhibit on the body. Proviron does not however increase testosterone production in the body. Proviron is also used as an anti-estrogen as well. Proviron provides a dual blocking scheme in that it prevents the aromatization of steroids as well as competes with estrogen to block the receptors as well.

The bad thing about Proviron is that it does not help in maintaining strength and muscle gains after a steroid cycle whereas HCG, Clomid, and Teslac do. This reason alone keeps some people from using this drug. Proviron does however block gyno and the increased water retention that steroids give the user. Proviron does allow increased muscle hardness since the estrogen levels will be low which is of great benefit for a precontest bodybuilder.

Proviron Effective Dose: 50 -100 mgs. per day by taking one to two 25 mg tablets in the morning and one to two 25 mg tablets in the evening.

Proviron Street Price: It normally sells for between \$1.50-2 per tablet on the street.

Proviron Stacking Info: This drug is commonly taken with Teslac, HCG, or Clomid. It is a popular precontest drug to increase muscle hardness. When taken along with Nolvadex, it almost completely blocks the effects of estrogen.
