

Testosterone Propionate Profile

Testosterone Propionate Profile

Substance: Testosterone Propionate

Testosterone Propionate is a common oil-based injectable Testosterone. The added Propionate extends the activity of the Testosterone but it is still comparatively much faster acting than other Testosterone esters such as Cypionate and Enanthate. While Cypionate and Enanthate are injected weekly, Propionate is most commonly injected at least every third day to keep blood levels steady. For strength and muscle mass gains, this drug is quite effective. With Propionate, androgenic side effects seem somewhat less pronounced than with the other Testosterones, probably due to the fact that blood levels do not build up as high. Users often report less gyno trouble, lower water retention and commonly claim to be harder on Propionate than with the others. This however is still a Testosterone and, as with all Testosterone products, androgenic side effects are unavoidable. It should also be noted that Propionate is often a very painful injection. Users very regularly report swelling and noticeable pain for days after a shot.

Testosterone Propionate Effective Dose: 200 - 600 mgs. / week

Testosterone Propionate Street Price: \$150 - 200 / 10 cc. vial (200 mgs. / cc.)
